Dear Readers,

In this issue of TELE-audiovision we are introducing a number of surprising new developments. For example, we have a report on a product that lets you carry TV signals over a network cable. With that, all of the old ideas vanish, for example, the thought that if you're carrying TV signals, you'd better use the proper coax cable. This statement is no longer true; you can now use cable that was never meant to be used for that purpose. Another example is a miniature antenna that you can position any way you want to; we are introducing it here in a test report.

Yet another example is a filter that can reduce the potential errors in an SCR network to zero. These are all new products that go to show that beliefs that have been held for quite some time don't always last forever. And you can never be sure if some new development or new product opens up possibilities that had never even been considered before. Even something as common as "F" connectors can be surprisingly improved as you'll see in another test report in this issue of TELE-audiovision.

Even with digital TV receivers there's no end to innovative

creativity. You might think that everything that could have been invented has already been invented but as you'll see in this issue we're once again reporting on something uncommonly new: the automatic generation of channel lists based not only on your own viewing habits but also those of other viewers.

Will there ever be an end to surprising new developments? Not a chance. It will always be possible to build on something that already exists.

It's a never-ending process; every new idea leads to yet another new idea. There's no end to it and that means that TELE-audiovision will always have something new to introduce. There's no end in sight!
